

## Sample Proofreading Service 2

E-Commerce involves transactions via the internet or on-line buying and selling of goods and services. E-Commerce is carried out through various electronic forms of communication, for instance, e-mail or facsimile or use of telephone calls via the internet. Additionally, using E-Commerce, many companies across Europe and UK have been able to showcase their products and have also been able to interact with their key consumers. It is obvious that in such transactions there are many legal concerns due to malpractices and breach of contract as transactions involve agreements. It is a process that cannot disregard the security of all parties in the sense that the process ought to be safe, authentic, and effective. On line transactions may also be based on a contractual basis and this makes it even more risky and complicated. So, many regimes especially in the UK and indeed, across Europe have seen the need to provide E-Commerce trading with the necessary legal protection and regulations. Any law in E-Commerce should focus on the actual transactions that are carried out electronically.

That said the dissertation will look in depth at E-Commerce in order to provide more insight into it. As mentioned earlier, E-Commerce involves a lot of transactions between the buyer and the seller and no wonder most regimes have deemed it wise to provide legal regulations to govern and safeguard all parties' from arbitrary exploitations and malpractices. The study will evaluate the main tenets of the United Nation Convention on Contracts for the International Sale of Goods and how it has been affected by processes in e-commerce contracts.
